

**WEEK 5 Module 17**

# **Getting Started with Product Design**

## CRUD Operations in Express

CRUD (Create, Read, Update, Delete) operations allow you to work with the data stored in your database – in our case, this database is our MongoDB database.

The CRUD operation documentation is categorized in two sections:

- Read Operations find and return documents stored within your MongoDB database.
- Write Operations insert, modify, or delete documents in your MongoDB database.

It is also important to note that some operations combine aspects of read and write operations.

CRUD operations make use of the standard HTTP methods namely:

- Create (POST) - Make something
- Read (GET)- Get something
- Update (PUT) - Change something
- Delete (DELETE)- Remove something

In this module, we will learn about CRUD operations by publishing posts to our Wordy App, retrieving posts from our Wordy App, updating posts on our Wordy App, and deleting posts from our Wordy App.
