WEEK 2 Module 8
NPM: Node Package Manager

Basics of Node Package Manager

npm - global command, comes with node

 npm –version

 local dependency - use it only in your current project

npm i <packageName>

global dependency - use it in any project

npm install -g <packageName>

sudo install -g <pacakageName>

To remove a package from your project

npm uninstall <packageName>

package.json - manifest (stores important info about project/package)

manual approach (create package.json in the root, create properties etc)

npm init (step by step, press enter to skip)

npm init -y (everything gets set to default)
